Base64-Converter is a software program which can be used in order to decode Base64 strings, as well as encode body texts, with a minimal amount of effort. The

conveniences of a portable app The installation process is not a necessity, as this product is portable. This means that, unlike installers, it is not going to update the Windows registry and Start menu/screen with new

items without your approval, and no remnants are going to be left behind after its removal from the disk. You should also keep in mind that Base64-Converter can be used on the fly, on any computer you come in

contact with, by simply moving the program files to an external data device. Intuitive environment and simple method of use The interface is minimal and clean, as it only includes a menu bar, two buttons and a pane in which to

input text and view results. In addition to that, Help contents are incorporated, thus ensuring that all user categories can find their way around it with ease. In order to encode a selected body text, all you have to do is paste it

in the main window and click the "Encode" button. The same steps are also available for decoding strings, and regardless of the one under way, the results are going to be revealed immediately. No other notable options are

integrated. Bottom line In conclusion, Base64-Converter is a simple, yet pretty efficient piece of software, dedicated to all user categories who want to decode Base64 strings or encode texts with this algorithm. The response

time is very good, the system's performance is not burdened and our tests did not reveal any errors or crashes in our tests. Encoding and Decoding of Base64 strings Before a body text is encoded, the user may wish to ensure that

certain letters are not encoded at all, using the encoding mode method. This is achieved by selecting the "No encoding" option, and setting the parameters that are most appropriate for the encoded text. The user is also allowed to

divide the text up into blocks, using the "Break text on" function. After the text has been encoded, it is possible to decode it, which will result in a similar body text. In the case that the initial text string does not have any letters that will

be decoded, the "No decoding" option will be available.
