The non-pyretic infants are not under-represented in the cases; the population of non-pyretic infants is known to be older than the population of infants that are presented with hypoxia [bb0115], [bb0140]. Few prior studies have examined the response of the immune system of preterm infants. One study showed that umbilical cord blood cytokine levels were different in EOS and LOS infants. While EOS infants had higher IFN- γ and TNF- α levels, LOS infants had higher IL-6 levels [bb0145]. In another study of preterm infants, IL-1 and IL-6 levels were elevated in the plasma of infants with sepsis compared to controls [bb0150]. Taken together with our current data, these prior studies suggest that preterm infants have dysregulated immune responses. In preterm infants, an increase in IL-6 is associated with a more severe course of the infection and with failure of early treatment [bb0155]. In the case where infection has been indicated and antibiotic treatment started, a limited number of studies have demonstrated that the pro- and anti-inflammatory cytokine balance is restored to pre-infection levels [bb0160]. The limited number of studies on preterm infants treated with antibiotics indicate that anti-inflammatory cytokine levels are higher than proinflammatory ones, but without any differences between LOS and EOS in the level of TNF- α . In the case of IL-6, one study has shown higher IL-6 levels after 48 h of treatment in the EOS group than in the LOS group.
