JSCAPE Reverse Proxy is a proxy server that allows you to access, in a secure and anonymous way, your data from the Internet (through a Web browser, for instance), thus providing you with a competitive edge. A: A reverse proxy is a piece of software that transparently interposes between a user on the Internet and a server behind a firewall on your internal network. For example, if you are running a web server on your network and you want your customers to be able to access it, but you want to protect your server from outsiders, you can configure a reverse proxy to intercept all traffic destined to your server and forward it to your server. The proxy sits between the user and the server, and intercepts any requests made to the server, rewriting the requests with a specific set of headers. The proxy will pass on the original request, and pass on the response to the user in the same format that it was originally sent by the server. For instance, if the user made a request like so: GET /home HTTP/1.1 Host: www.example.com the proxy will send a response like this: HTTP/1.1 200 OK Date: Thu, 08 Dec 2009 15:03:14 GMT ... The proxy is also responsible for caching the data from the server, so if the user makes the same request again, the proxy can send the response back to the user directly. In many cases this will speed up the user's experience because the data for the next page request will already be cached and there is no need for the server to make a new request and wait for the response to return.

KEYMACRO is a friendly, graphical, Java-based WYSIWYG MACRO trading language IDE that is designed to be simple to use, but can also handle some of the more complex trading languages such as ROOT, CQL, and PPS. KEYMACRO runs on all major platforms and browsers. In particular, we support: JAVA 1.4 or later (5.0 and above recommended). JRE 1.2.x - 1.6.x JSCAPE-REVERSEPROXY 1.2.1 Note: JSCAPE-REVERSEPROXY 1.2.2 has not been tested to work with either PPS or ROOT macros. What's New in the?

JSCAPE Reverse Proxy is a platform independent reverse proxy server that allows your trading partners to access your data without having to open ports on your internal network or store sensitive information in the DMZ. JSCAPE Reverse Proxy is free open source software under the GNU GPL 2.0 license. The JSCAPE Project Web site is JSCAPE is an acronym for Java Server CARriE Project and is abbreviated as JSCP. JSCAPE is a Java Web server application built to be platform independent, lightweight, and easily configurable. It should easily serve as a reverse proxy to any application that has a Java API or a Java Servlet. JSCAPE can be easily configured to map HTTP requests to different Java servlets and/or web applications. JSCAPE uses the Sun Java Plug-In architecture (JNLP) and

works with the latest version of the Sun Java Plug-In 2.0. JSCAPE is extensible to allow integration with other Java Server Pages (JSP) and Servlets. JSCAPE is implemented as a Java servlet and works with any web server running on the J2SE 1.4.1 or later platform. JSCAPE also includes a web application that can be used to add functionality to a running JSCAPE application. Installation: There is an installer for both Linux and Windows for JSCAPE to install in the operating system directory. JSCAPE is set up in the web applications/jscape folder. There are five operating modes: None - JSCAPE will not do anything at all. Debugging - Used to debug the error messages that occur during startup. Stop - This is the mode that will be used when using the stop method. Start - This is the mode that will be used when starting the server. Info - This mode will only be displayed if running as a Java Web application Tutorial: You can find a lot of tutorials for JSCAPE at Getting Started: In this tutorial you will set up a very simple JSCAPE installation on Linux. The basic steps to do this are: Install the JSCAPE package: `sudo apt-get install jscape` Run jscape in the same user as the Apache web server: `sudo jscape -f` Run jscape in the current user as a Java Web application: `sudo jscape -f jscape -classpath jscape/lib/servlet-api.jar jscape/webapps/jscape/jscape` This is an example of the output when running the jscape web application: J

\*Microsoft Windows 8.1 or later \*3.2 GHz Core 2 Duo / AMD Phenom II X4 \*3 GB RAM \*1 GB VRAM  
\*Adobe Creative Suite 6.0 or later \*DVD-RW or BD-RW for installs \*HDD Space: 25 GB (Install files may require 10 GB+) \*Internet Connection \*Mac OS 10.6 or later \*2.5 GHz Intel Core Duo / AMD Athlon 64 X2 \*2 GB RAM
