Fortunately, you're never forced to go back to the basics. Photoshop Elements does a good job with quick touches. You can use it for simple tasks, and it's good for making families' holiday cards and slideshows. Fireworks, with its quick share functionality, is even better for creating flashy presentations. Even the hardcore photoshoppers I've met wouldn't hesitate to say that Photoshop's power and versatility surpass anything else out there. The enormous potential latent in Photoshop is still what makes it so great. Most techniques look unnatural until you learn them. One of the easiest is to use the Gaussian Blur tool. The easiest way to learn this fascinating tool is to blur a full-sized photo, which you can duplicate easily. Once you've done that, start reducing the size of the photo and zooming into areas of fine detail. The more detail you have, the greater the blur, which reveals the fine lines that would otherwise be invisible or very difficult to see. You'll note that even on small-scale images, you're able to create a pleasing blurred effect without a lot of fuss. Photoshop offers a bewildering array of choices for different tasks, and it's often easier to make the wrong choice than the right one. So it's important to understand those choices and why they were made. For example, Photo is a completely different program to Photoshop, having been designed from the outset with the needs of photographers in mind. If you make sure you have a selection active in the mask, you can then apply effects and layer options the way you normally would **What it does:** To create a new color or modify an existing one, simply press on the color you want to work with, which will give you a list of options and options. If you want to make the color brighter or darker, select the new option and you'll see the color you chose on a color gradient that starts from the RGB values in a box, and goes into a palette of colors. Click on the one you want and you can see the specific values (255, 255, and 255, for example) that will correspond to your hue, saturation, and lightness information. Depending on how often and how large your projects are, it may not fit within your available resources if you ran Photoshop on a standalone computer. For that reason, designers need to get Photoshop out of their head and onto a more efficient tool called the cloud.
