I've tried to bring down the learning curve as much as possible in Lightroom 5. It's a better experience from the get go, and it's not as buggy as some other iterations. In fact, there really are only a couple of issues highlighted by readers on the Adobe discussion boards. That said, we can be sure the company will fix them quickly, as it always does. With the consumer-grade versions of Photoshop, there is a distinct lack of natural editing without having to spend hours dutifully cutting and pasting the layers. With Lightroom, the same is true but to a greater degree. A buffering system means an image edit can be loaded up and made, with no preparation, just like any other popular social media app. If you've ever edited a photo, then Photoshop's Basic Editing tab is the same one you'll know. There are two major differences. The first is the addition of layers compression. You now have the ability to compress layers, meaning that made-up adjustments will not affect the image's previous ones. This is an incredibly useful function, since layers are unlikely to be compressed with regular editing. The other major difference in the workflow is the introduction of an additional layer called the Stack. Many Photoshop users say they never use this tool, since they are already used to having multiple adjustment layers. I'm one of those people. I often find it convenient to make an adjustment to a layer, then go back and adjust it again with other layers intact.
